Mawhiba Research Enrichment Program at AR-CEMS

موهبة

The Applied Research Center for Environment and Marine Studies (AR-CEMS) at KFUPM has been an active partner in the Mawhiba Research Enrichment Program, providing continuous mentorship and training for talented high-school students across the Kingdom. Each year, students are immersed in hands-on experimental work, scientific investigation, and advanced material characterization, while also developing essential skills in teamwork, leadership, critical thinking, and scientific communication. In 2025, out of 58 talented students selected for the program at KFUPM, 25% were hosted at AR-CEMS, their projects were supervised by our researchers across six specialized research areas. This sustained engagement underscores the center's commitment to nurturing future scientists and empowering them to present their innovative research in professional scientific forums. In 2026, we continued this commitment by giving high school students hands-on research experience through practical laboratory training and supervised project work.

Building on the success of the Mawhiba Research Enrichment Program, AR-CEMS organized a dedicated Mawhiba exhibition during the third edition of the Center's conference (GiKS 2026). The exhibition showcased students research projects through a competition designed especially for Mawhiba participants. It gave them the opportunity to present their work to a wider audience, build confidence, and develop their scientific communication skills.
